# Major Take-Away

- Horizontal vs. Vertical Re-engineering

# Challenges Faced By A MUMPS Application

- Expert friendly
  - Dated coding style
  - Arcane rules, sometimes violated, exceptions not well documented
  - Human interaction not always well separated from business logic
    - User interface technology changes faster than business logic
- Other management concerns
  - Ability to staff
    - New programmers not always willing to invest time & energy in learning
- Relentless promotion by big-brand RDBMS vendors
  - Long-term viability of M technology questioned

# Challenges Faced By A MUMPS Application

- Expert friendly
  - Dated coding style
  - Arcane rules, sometimes violated, exceptions not well documented
  - Human interaction not always well separated from business logic
    - User interface technology changes faster than business logic
- Other management concerns
  - Ability to staff
    - New programmers not always willing to invest time & energy in learning
- Relentless promotion by big-brand RDBMS vendors
  - Long-term viability of M technology questioned

***And I'm not talking about VistA!!!***

# FIS Profile in the mid 1990s

- Similar concerns to those that apply to VistA today
  - Terminal based primary user interface – mostly screens & menus
  - Thick client written in PowerBuilder for most common users
    - No thin client interface & web was just taking off
  - Thousands of routines of hand-coded M
    - Mostly well written – but not always
    - Well-defined schema – by-passed occasionally
    - Without transaction fences, application Consistency not assured after a crash

N COUNTER

I '\$G(DATE) S DATE=\$S(\$G(TJD):\$D(TJD),\$G(^CUVAR(2)):1)

I '\$G(NBD) S NBD=1

I \$G(CAL)=" " S CAL="IBS"

S COUNTER=NBD

F D Q: 'COUNTER

. S DATE=DATE-1

. I \$\$BD(DATE,CAL) S COUNTER=COUNTER-1

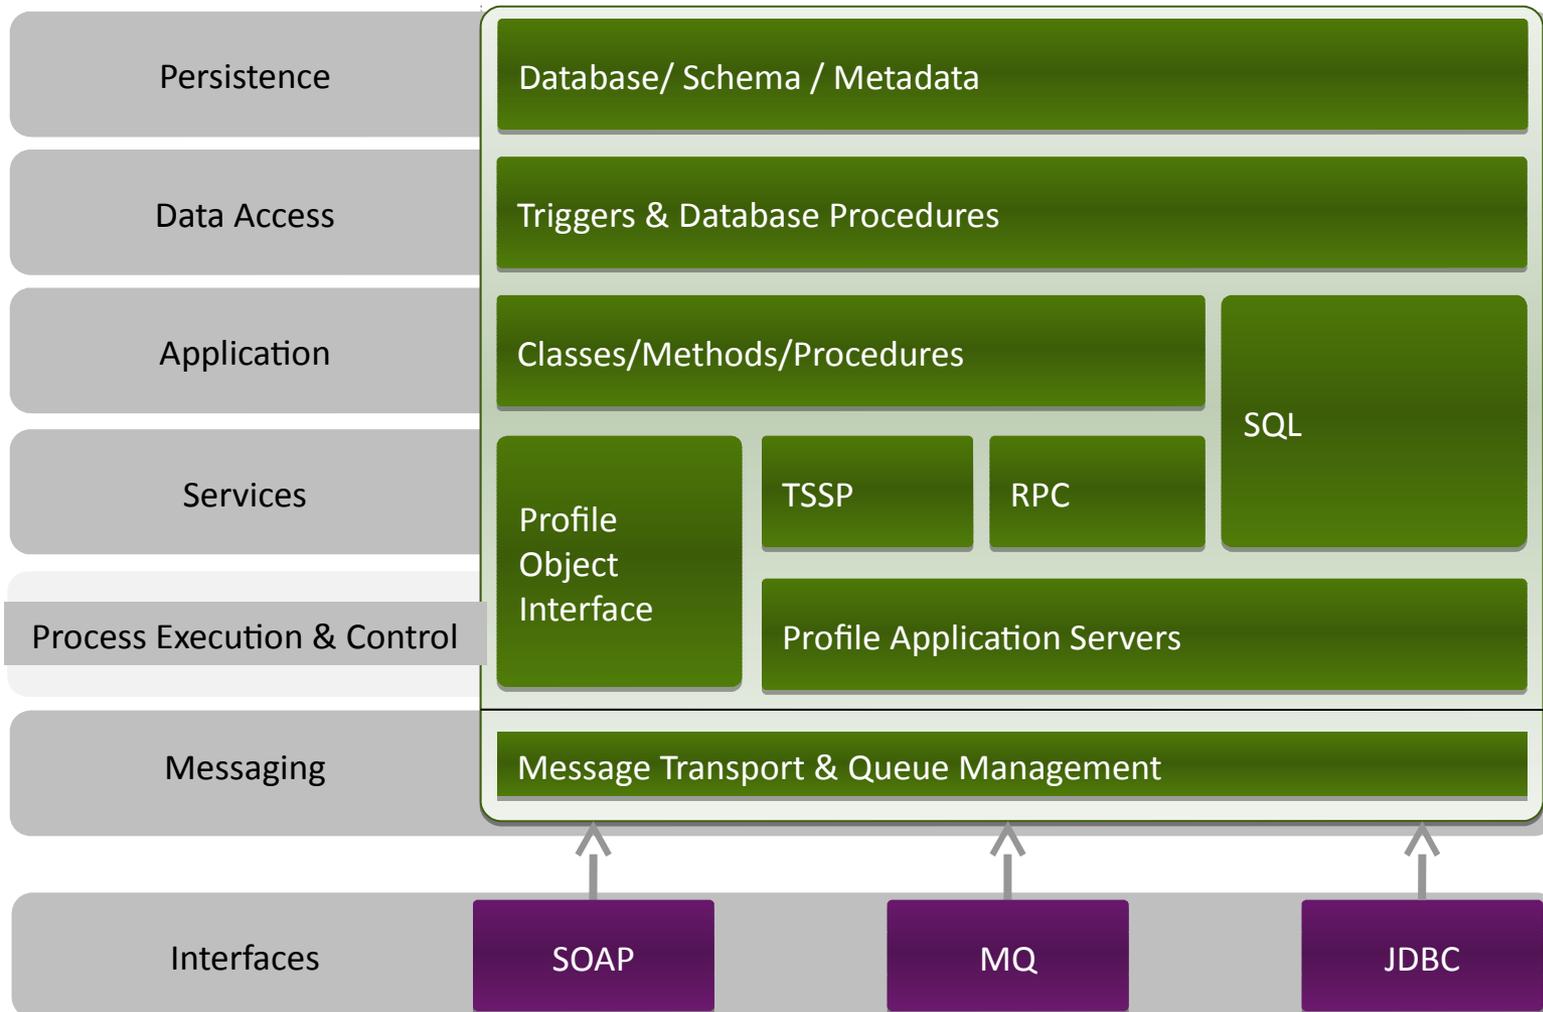

Q DATE

# FIS Profile today

- Runs three largest real-time core banking systems in the world
  - (If you know of any bigger, please do let me know)
- Stateless server processes receive and respond to messages
  - Service requests are TCP/IP messages (“transfer \$100 from checking to savings”), independent of UI technology
    - New UI technologies can be added with little to no change to servers
  - Each request processed as an ACID transaction
    - Database recovered after crash guaranteed to be application Consistent
    - Maintaining Consistency with Logical Multi-Site application deployments for business continuity are easier if all updates are wrapped in transactions
    - M Locks no longer needed
    - (Transactions work so well, they are even used for “batch” processing)
  - SQL/JDBC access to application
  - Deployable on big-brand RDBMS
    - No technical obstacle preventing Profile from running on Java or other languages (will only require retargeting code generator of PSL compiler)

# Profile Architecture

# Profile Scripting Language (PSL)

```
type String COUNTER // Type checking done by compiler

if 'DATE.get() set DATE = %SystemDate // Object.method notation enforces schema
if 'NBD.get() set NBD = 1 // and allows compiler to generate code
if CAL.get() = "" set CAL = "IBS" // for multiple targets

set COUNTER=NBD

for do { quit:'COUNTER // Block structure and flexible whitespacing
  set DATE = DATE-1 // can make code easier to read & maintain
  if $$BD(DATE,CAL) set COUNTER = COUNTER-1
}

return DATE // DNA shared with M
```

# Profile IDE

The screenshot displays the Profile Developer IDE interface. The main window is titled "Profile Developer - ProfileDev/dataqwik/procure/TRNDRV.PROC - Eclipse". The interface includes a menu bar (File, Edit, Navigate, Search, Project, Run, Window, Help), a toolbar, and several panes:

- Navigator:** Shows a tree view of the project structure.
- Profile Explorer:** Contains a search box with "transaction" and a table listing various transaction types and their descriptions.
- SQL Editor:** Displays PL/SQL code for the TRNDRV.PROC procedure, including comments and logic for handling account transactions and segments.
- Outline:** Lists the procedure names: TRNDRV, TRNSET, TRNSINGL, TRNBATCH, EXEC, EXECMISC, and FILEEXEC.
- Resource Properties:** Shows properties for the selected resource.
- Diagram:** A database diagram showing relationships between tables. The "Deposit File" table is linked to "ACN, DEP" and "ACN", which in turn is linked to "Customer Information".

```
419  If account is passed in, save the contents. In the event of a
420  transaction failure, the account object will be restored to it's
421  original state.
422  */
423  type RecordACN acnsave1, acnsave2
424  if acn1.exists() set acnsave1 = acn1.copy()
425  if acn2.exists() set acnsave2 = acn2.copy()
426
427  #IF (CUVAR.NOSEGMENTS'=1)!($$SEGUSE^BITOPTMZ(""))
428      type Number SEGMENT = ""
429      type RecordACNSEG acnsegsave1(), acnsegsave2()
430
431      for set SEGMENT = acnseg1(SEGMENT).order() quit:SEGMENT.isNull() se
432
433      set SEGMENT = ""
434      for set SEGMENT = acnseg2(SEGMENT).order() quit:SEGMENT.isNull() se
435  #ENDIF
436
```

Table List:

Table	Description
CMSOPT	Card Transaction Param
CTR	Currency Transaction Re
DAYENDCMSHL	Hold Created for Pendin
DAYENDCSH	Cash Transaction File (De
DAYENDSWPF	Day-End Sweep Transact
DAYENDSWPFA	Day-End Anticipated Swe
DEALREFNO	Deal Index File (Transacti
DENTRAN	Denomination Transactio
DMJTMP	All Miscellaneous Transa
DTJ	Daily Transaction Journa
DTJTMP	Deposit/Loan Transaction
DTX	Teller Transaction
EACTXNIMP	External Account Transac
FVFNTTO	Event Transaction Outpu

Diagram Relationships:

- CID → Deposit File
- ACN, DEP → Deposit File
- ACN → Customer Information

### Report Modify

Report Name: CUSTOMER LISTING OVER 35

\* Description:

Limit Rows:

Rows:

```
1 SELECT
2     CIF.NAM,
3     CIF.AGE,
4     CIF.TCUSTBAL,
5     CIF.STAT
6 FROM
7     CIF
8 WHERE
9     CIF.AGE > 35
```

\* WebSQL:

# Access from DBVisualizer

The screenshot displays the DBVisualizer interface. On the left, the 'Connections' pane shows a tree view with 'PIP' expanded to 'PROFILESHEMA', which contains a 'TABLE' folder with 'ACN' selected. The main window shows the 'Table: ACN' metadata. The breadcrumb path is 'PIP | PROFILESHEMA | TABLE | ACN'. Below the breadcrumb are tabs for 'Primary Key', 'Indexes', 'Grants', 'Row Id', and 'References'. A secondary row of tabs includes 'Info', 'Columns', 'Data', and 'Row Count'. The 'Info' tab is active, displaying a table with the following data:

Name	Value
TABLE_CAT	(null)
TABLE_SCHEM	PROFILESHEMA
TABLE_NAME	ACN
TABLE_TYPE	TABLE
REMARKS	Account file
TYPE_CAT	(null)
TYPE_SCHEM	(null)
TYPE_NAME	(null)
SELF_REFERENCING_COL_NAME	(null)
REF_GENERATION	(null)

# How did Profile get here from there?

- No magic... just innumerable cycles of recoding / rearchitecting

# What does this imply for VistA?

- Revolution through evolution
  - Changes over a half dozen major versions over as many years
  - Pick your pithy saying...
    - Incremental changes are safer than big bangs
    - Many small steps can make a big journey
    - Patience is not the same as paralysis
    - Eat the elephant one bite at a time
    - Spread the cost over several budget years
    - No “none of it is done till it's all done” malady
    - Confidence in code comes from using it
    - You can wait forever for the perfect solution
    - The longest journey is the one that is never begun

# What does this imply for VistA?

- Revolution through evolution
- Avoid encapsulation
  - Encapsulation creates logic that resists change
    - No knowledgeable programmers, changes perceived as high risk
  - Unchanging code leads to ossification and fossilization
  - And in turn, premature application obsolescence

# What does this imply for VistA?

- Revolution through evolution
- Avoid encapsulation
- Choose a language and compile it into M
  - Choice of language not important as long as it's “good enough”
    - We created PSL (now free / open source software – <http://fis-pip.com>)
    - JavaScript, PHP, Python, and Ruby will all probably work
    - Java and .Net have fans and detractors
    - Proprietary languages don't match free / open source ethos of VistA
  - Choose a well defined subset
    - Every language has its idiosyncrasies and this is not a good time to explore them
  - Importance of compiling into M cannot be emphasized enough
    - Granularity of change is the line, not the module
    - New code and old code can share local variables and other context
    - Code dynamically generated from templates in the database continues to work
    - Facilitates some conversion automation – see a pattern and convert it everywhere
  - Enforce coding discipline with new code, e.g., direct global accesses
    - Mandatory for application deployment on non-M databases

# What does this imply for VistA?

- Revolution through evolution
- Avoid encapsulation
- Choose a language and compile it into *M*
- Re-architect as you go
  - Some changes may be “lumpy” - requiring all of the application to do something the new way, e.g., generating code for an RDBMS target required zero direct *M* global access and 100% access through schema layer
  - Other changes are not, e.g., use of transaction processing

# What does this imply for VistA?

- Revolution through evolution
- Avoid encapsulation
- Choose a language and compile it into *M*
- Re-architect as you go
- Integration beats Balkanization
  - It's tempting and sometimes expedient to replace pieces with “best of breed” applications
  - Breaking off pieces of core business logic converts an integrated patient/customer-centric architecture into a stovepipe architecture – see <http://sourcemaking.com/antipatterns/software-architecture-antipatterns>
  - That said, sometimes slicing off functionality is the right thing to do, e.g., UI

# What does this imply for VistA?

- Revolution through evolution
- Avoid encapsulation
- Choose a language and compile it into *M*
- Re-architect as you go
- Integration beats Balkanization
- The value of *M* technology is as an execution engine
  - Leverage *M* for what it does well – compact & efficient *M* code scales up to the needs of the largest enterprises
    - “Indistinguishable from line noise” doesn't matter for code generated by a compiler
  - *M* does not need to be the next “cool” programming language
  - Establishing value is the key to ongoing investment
    - Compiling PSL to run Profile on a big-brand RDBMS and generating Java from PSL established the importance of GT.M in a way that no amount of white papers or slide decks ever could have done

# What does this imply for VistA?

- Revolution through evolution
- Avoid encapsulation
- Choose a language and compile it into M
- Re-architect as you go
- Integration beats Balkanization
- The value of M technology is as an execution engine

**Horizontal vs. Vertical Re-engineering!!!**
